

Experience

Business Operations

Cross-Functional Project Coordination

Business Consulting Days — Event Planning & Execution

I worked closely with the Events team to plan and execute the annual **Business Consulting Days**, a recurring initiative bringing consultants from across the department together for knowledge sharing, networking and team building.

My involvement covered both the planning and execution phases. I supported the development of the event agenda, coordinated with internal stakeholders and guest speakers, managed invitations and attendee communications, and supported the nomination and registration process. During the event itself, I contributed to on-site coordination and ensured that different stakeholders, sessions and activities were running as planned.

This required coordinating across multiple functions and managing many parallel activities, while ensuring that the event objectives and participant experience were maintained.

Key areas: Event management · Stakeholder coordination · Project coordination · Communication · Planning & execution

Business Analysis & Market Research

European eHealth Market Entry Analysis

I supported the Consulting department in assessing potential European markets for the expansion of a new **eHealth portfolio**.

I conducted comparative market research across multiple European countries, looking at factors including existing eHealth initiatives, government incentives, digital-health development and broader digital/eHealth indicators. I consolidated the findings into a structured comparison to identify markets with the strongest potential.

Based on the analysis, I developed recommendations for **three priority markets** where Siemens Healthineers could consider focusing its future efforts. I then translated the research and recommendations into an **executive-level presentation**, making the findings accessible for decision-making by senior stakeholders.

Key areas: Market research · Competitive/market analysis · Strategic recommendations · Data synthesis · Executive presentations

Learning & Development

Learning & Development Initiatives

I supported the Learning & Development team in designing and implementing initiatives aimed at improving the development and knowledge-sharing opportunities available to consultants.

My work involved helping structure learning content around different consultant needs and contributing to the development of more systematic approaches to professional development.

Rather than treating training as individual sessions, the focus was on creating resources and structures that consultants could access and use as part of their ongoing development.

Key areas: Learning & Development · Training coordination · Content structuring · Stakeholder collaboration · Professional development

Learning Pathways

Consulting Learning Pathways

In collaboration with the Learning & Development team, I designed and implemented **four learning pathways** tailored to consultants at different stages of their careers, including new, junior and senior consultants.

The pathways were structured around the different **skills and development needs** associated with each level. I brought together online training, training materials and recorded sessions into structured learning journeys that consultants could access at any time.

The objective was to move from a collection of individual training resources toward a more structured and accessible development system, making it easier for consultants to understand **what they should learn, when they should learn it, and where to find the relevant resources**.

Key areas: Learning design · Knowledge management · Training strategy · Content curation · Process design

Business Excellence & Process Improvement

Business Excellence Support

I worked with the **Business Excellence team** on process improvement and ideation initiatives within the consulting organization.

My contribution involved identifying opportunities to improve existing ways of working, developing ideas for more efficient processes and supporting the exploration of potential solutions.

This gave me exposure to the operational side of the organization — looking not only at what teams were doing, but also at **how processes could be structured differently to improve efficiency, consistency and usability**.

Key areas: Process improvement · Operational excellence · Ideation · Problem solving · Continuous improvement

Knowledge Management

Consulting Knowledge Management Portal

I collaborated with the Business Excellence team to implement a **knowledge-management portal** designed to make the consulting organization's internal knowledge and resources easier to find and use.

One component was a **Power BI-based overview of 100+ consultants**, bringing together information about their areas of knowledge, locations and previous projects. The purpose was to make it easier for consultants to identify colleagues with relevant experience and connect with them for **best-practice exchange, advice and expertise**.

We also structured a resource library around the consulting portfolio, bringing together processes, templates, materials and documents that consultants could use when starting new projects or looking for examples and resources from previous work.

The broader objective was to reduce the time spent searching for information, improve internal knowledge sharing and make existing organizational knowledge more reusable across projects.

Key areas: Knowledge management · Power BI · Information architecture · Process improvement · Internal collaboration

Internal Expertise Search

Consultant Expertise Discovery

As part of the knowledge-management initiative, I helped develop a mechanism that allowed consultants to more easily identify **internal colleagues with relevant expertise**.

The system connected information such as consultants' knowledge areas, locations and previous project experience, allowing users to find colleagues who could provide relevant knowledge, examples or best practices.

This addressed a common organizational challenge: the knowledge already exists within the company, but employees may not know **where it is or who possesses it**.

The initiative therefore focused on turning dispersed individual knowledge into a more accessible organizational resource.

Key areas: Knowledge discovery · Internal networking · Data structuring · Knowledge management · Best-practice sharing

Digital Transformation & Tool Implementation

Monday.com Staffing & Project Management Implementation

This is probably one of your **strongest individual examples**, and I'd give it substantial space on your website.

Following the selection of Monday.com as the new platform, I took ownership of significant parts of the implementation process. I conducted the **first vendor demonstration**, learned the platform independently, translated the organization's operational requirements into system functionality, and designed the initial solution.

Over approximately **five months**, I worked from vendor onboarding through to piloting the platform with **five teams and around 30 consultants**.

I designed **five dashboards**, each serving different operational purposes, including:

- **Staffing management** — supporting the allocation of consultants to projects
- **Project management** — providing visibility into project activities and status
- **Leadership reporting** — giving leadership visibility into staffing forecasts and business opportunities
- **Revenue visibility** — supporting the tracking and forecasting of potential revenues
- **Effort/capacity planning** — helping understand consultant availability and expected workload

Beyond the dashboards themselves, I configured **automations and workflows** to reduce manual work and standardize processes.

I also created user guidance and reports, conducted training sessions, collected feedback from pilot teams and established feedback loops to identify improvements before broader adoption.

This project gave me hands-on experience across the full implementation cycle: **understanding business requirements → learning the technology → designing the solution → building it → testing it → training users → collecting feedback → improving the system**.

Key areas: Digital transformation · Project management · Business process design · Tool implementation · Workflow automation · User training · Change management

Power BI & Operational Reporting

Power BI Dashboards

I used **Power BI** to support the visualization and organization of operational information within the consulting organization.

One major application was the knowledge-management initiative, where consultant information was structured into a dashboard covering **100+ consultants**, including areas of expertise, location and project experience.

The dashboards were designed not simply as reporting tools, but as practical decision-support and knowledge-discovery tools — helping consultants and stakeholders understand **who has relevant expertise and where organizational knowledge is located**.

Key areas: Power BI · Data visualization · Operational reporting · Data structuring · Decision support

Strategy

My experience in strategy combines business research, market analysis, structured problem-solving, and translating findings into recommendations that support business decisions.

European eHealth Market Entry Analysis — Siemens Healthineers

One of my strongest strategy-related projects was supporting the assessment of **potential European markets for a new eHealth portfolio**.

I conducted research across European countries, comparing factors such as:

- Existing eHealth and digital-health initiatives
- Government incentives and market support
- Digital-health maturity and relevant indicators
- Market conditions and potential opportunities

I structured the research to compare markets and identify where the portfolio could have the strongest potential. Based on the analysis, I recommended **three markets** for Siemens Healthineers to consider prioritizing and presented the findings in an **executive-level presentation**.

This experience gave me exposure to the process of moving from a broad strategic question to **structured research, market comparison, opportunity identification, and actionable recommendations**.

Strategy Through Business & Process Improvement

My strategic experience also comes from working on initiatives where the objective was to improve how the consulting organization operated.

Through projects such as the **Monday.com implementation, knowledge-management portal, learning pathways, and Business Excellence initiatives**, I worked with stakeholders to understand organizational needs, identify gaps, and develop solutions that could improve how resources, knowledge, and processes were managed.

These projects required looking beyond individual tasks to understand **how processes, people, technology, and information fit together** and how changes could support broader organizational objectives.

Academic Foundation

Strategy was also a core component of my Master's in **Innovation Management, Entrepreneurship and Sustainability**, where I developed knowledge across innovation strategy, entrepreneurship, business models, venture creation, and strategic decision-making.

My Master's thesis further strengthened my ability to work with a large body of information, synthesize evidence, identify patterns, and develop structured conclusions, based on an integrative review of **104 academic papers**.

What this experience demonstrates

Strategic analysis · Market research · Opportunity assessment · Business research · Market entry · Strategic recommendations · Business model thinking · Competitive analysis · Structured decision-making · Innovation strategy

Research & Evidence Synthesis

My academic and professional experience has developed strong research skills, particularly in **literature research, information synthesis, thematic analysis, and translating large amounts of information into structured insights.**

Master's Thesis — Entrepreneurial Mindset in Higher Education

For my Master's thesis, I investigated **the elements of entrepreneurial mindset and how they can be effectively developed and taught in higher education.**

I conducted an **integrative literature review**, working through a large body of academic research and systematically analyzing approximately **800 papers**, with **104 papers included in the final review.**

I used **thematic analysis and the Gioia methodology** to identify, organize, and synthesize patterns across the literature and develop a structured understanding of the different elements of entrepreneurial mindset and how they can be developed through education.

The research required me to:

- Define and refine research questions
- Conduct systematic academic literature searches
- Screen and evaluate a large volume of research
- Identify relevant and credible sources
- Extract and organize information
- Identify recurring themes and patterns
- Synthesize findings across different studies
- Develop structured conclusions from complex information
- Translate academic findings into practical implications for higher education

I completed the thesis with a **1.0 German grade**, the highest grade on the German grading scale.

What this experience demonstrates

Research · Literature review · Evidence synthesis · Thematic analysis · Qualitative research · Critical thinking · Information analysis · Pattern identification · Research methodology · Structured problem-solving

Project Management

Client-Facing Project Management — Atheneum

2+ years | Associate → Team Leader

Managed **10+ concurrent client projects** on a daily basis across different industries, taking projects through the full delivery lifecycle.

- Translated **client requirements** into clear project briefs and delivery plans.
- Launched projects and conducted targeted research to identify relevant **industry experts**.
- Personally interviewed and qualified experts to assess their expertise and fit with client needs.
- Coordinated **clients and experts**, including scheduling consultations and managing communication.
- Monitored project progress, resolved issues and ensured **client satisfaction** throughout delivery.
- Managed project closure, including feedback collection and ensuring expert remuneration was completed.
- As a **Team Leader**, additionally supported team coordination and project delivery across multiple engagements.

Core experience: End-to-end project management · Client management · Requirements gathering · Research · Stakeholder coordination · Prioritization · Team leadership

Internal Projects & Business Transformation — Siemens Healthineers

Managed and contributed to cross-functional projects spanning **Business Excellence, Learning & Development, Events, Marketing and Consulting**.

- **Digital implementation:** Led significant parts of a **5-month Monday.com implementation**, from vendor onboarding through to piloting with **5 teams / ~30 consultants**; independently built dashboards, workflows and automations, and supported user training and feedback.
- **Knowledge management:** Co-developed a knowledge-management portal covering **100+ consultants**, using Power BI to connect expertise, location and project experience and facilitate internal knowledge sharing.
- **Learning & Development:** Created **4 structured learning pathways** for new, junior and senior consultants, combining online training, materials and recordings.
- **Market analysis:** Conducted European **eHealth market research**, evaluating country-level initiatives, incentives and digital-health indicators and recommending **3 potential priority markets** for a new portfolio.
- **Events:** Coordinated the planning and execution of annual **Business Consulting Days**, working with Events, stakeholders and guest speakers.
- **Business Excellence:** Supported **process improvement and ideation** initiatives aimed at improving consulting operations and ways of working.

Core experience: Cross-functional project management · Digital transformation · Process improvement · Knowledge management · Business analysis · Stakeholder management · Change & implementation

Analytical Problem-Solving

Analytical Problem-Solving

I approach problems by breaking them down into their underlying requirements, gathering the relevant information, and translating findings into practical solutions or recommendations.

Market Entry Analysis — Siemens Healthineers

One example was a market-entry analysis for a new eHealth portfolio in Europe.

The question was which European markets could offer the strongest opportunities for further expansion. I conducted comparative research across European countries, looking at factors including **existing eHealth initiatives, market conditions, incentives, and digital-health indicators**.

I structured the findings to compare markets, identified potential opportunities, and recommended **three markets** where Siemens Healthineers could focus its efforts. I then consolidated the analysis into an **executive-level presentation** to communicate the recommendation clearly.

Problem-Solving Through Process & Technology

My analytical problem-solving experience also extends beyond market research.

When supporting the implementation of **Monday.com**, I first had to understand how staffing and project information was currently managed and what different users needed from a new system. I translated these requirements into workflows, dashboards, and automations, testing the solution through a pilot and using user feedback to identify and address improvement areas.

Similarly, when developing the **consulting knowledge-management portal**, I worked on the problem of making internal expertise and previous project knowledge easier to find. I helped structure information around consultants' **skills, locations, and project experience**, using Power BI and a search mechanism to make relevant expertise easier to identify.

Across these projects, my focus has been on moving from **an unclear or inefficient process → understanding the problem → structuring information → identifying a solution → implementing and improving it**.

What this experience demonstrates

Analytical thinking · Problem-solving · Business research · Comparative analysis · Requirements analysis · Structured thinking · Research synthesis · Solution design · Recommendation development · Continuous improvement

Cross-Functional Collaboration

Cross-Functional Collaboration

Much of my experience has involved working across different functions, teams, and areas of expertise to move projects from idea to implementation. I am comfortable working with people who have different priorities and responsibilities, aligning their input and keeping everyone moving toward a shared outcome.

Learning & Development & Consultant Teams

At Siemens Healthineers, I worked closely with the **Learning & Development team and consulting leadership** to develop learning pathways for consultants at different career stages.

I helped translate identified development needs into **four structured learning pathways** for new, junior, and senior consultants, combining online training, learning materials, and recorded sessions. This required coordinating input from different stakeholders while ensuring the final pathways were practical and accessible for consultants.

Business Excellence & Digital Implementation

I also worked with the **Business Excellence team** on process improvement and digitalization initiatives.

One key example was the implementation of **Monday.com** as a new staffing and project-management solution. I worked across the vendor, Business Excellence, consulting teams, and leadership to translate operational requirements into workflows, dashboards, and reporting structures.

The project involved a **five-month implementation and pilot across 5 teams and approximately 30 consultants**, including user training, feedback collection, and iterative improvements.

Events & Consulting Teams

For the annual **Business Consulting Days**, I worked with the Events team and consulting stakeholders to coordinate a multi-day initiative bringing consultants together.

I contributed to agenda planning, stakeholder and speaker coordination, invitations, attendee management, nomination processes, and on-site execution, ensuring that the different teams involved were aligned throughout the process.

Client & Expert Collaboration — Atheneum

At Atheneum, cross-functional collaboration was central to my project-management role. I worked across **clients, internal project teams, and external industry experts** to deliver projects from initial client requirements through to completed expert consultations.

This involved translating client needs into clear requirements, coordinating different stakeholders, managing timelines, resolving issues, and ensuring that everyone involved had the information needed to deliver successfully.

What this experience demonstrates

Cross-functional collaboration · Team coordination · Requirements gathering · Alignment · Communication · Project delivery · Stakeholder coordination · Vendor collaboration · Knowledge sharing · Working across different functions

Stakeholder Management

Stakeholder Management

I have experience coordinating and managing stakeholders across internal teams, external vendors, consultants, and clients, ensuring that different expectations, requirements, and responsibilities are aligned throughout a project.

Flagship Experience: End-to-End Training & Bootcamp Management

At Siemens Healthineers, I **owned the execution of a one-week on-site training bootcamp for 10+ consultants**, working with an external training provider and multiple internal stakeholders.

My responsibilities covered the full delivery process:

- **Vendor management:** Acted as the main point of contact for the external training provider, coordinating requirements, timelines, logistics, and deliverables.
- **Agenda & program coordination:** Structured and coordinated the training agenda, ensuring sessions, speakers, and activities were aligned with the objectives of the program.
- **Training materials:** Coordinated the preparation and availability of training materials and supporting resources.
- **Participant coordination:** Managed communication and logistics for participating consultants before and during the bootcamp.
- **On-site execution:** Coordinated the event throughout the week, resolving issues and ensuring that sessions and activities ran as planned.
- **Feedback collection:** Gathered feedback from participants and stakeholders after the training to identify areas for improvement and inform future initiatives.

This required balancing the needs of **consultants, internal stakeholders, and an external vendor**, while maintaining ownership of the overall delivery.

Global Consulting Days

I also worked cross-functionally with the Events team to coordinate Siemens Healthineers' annual **Business Consulting Days**, a multi-day event bringing consultants together for collaboration and team building.

I contributed to:

- Agenda development and coordination
- Stakeholder and speaker coordination
- Invitations and attendee management
- Nomination processes
- Communication with participants and contributors
- On-site coordination and issue resolution

Client-Facing Stakeholder Management — Atheneum

At Atheneum, stakeholder management was a core part of my day-to-day project work. As a client-facing project manager and later Team Leader, I acted as a key point of contact throughout projects, managing communication between **clients, internal teams, and industry experts**.

I translated client requirements into project briefs, coordinated expert identification and qualification, arranged consultations, monitored project progress, addressed issues, collected feedback, and ensured that projects were successfully completed.

What this experience demonstrates

Stakeholder management · Vendor management · Client management · Cross-functional collaboration · Event & training coordination · Communication · Expectation management · Project delivery · Conflict & issue resolution · Feedback management

End-to-End Ownership ·

Process Improvement & Digital Transformation

Monday.com Staffing & Project Management Implementation

At Siemens Healthineers, I supported the implementation of Monday.com as a new digital solution for staffing and project management within the Global Consulting Organization.

The project started with a need to improve how consulting resources, projects, staffing needs, and business opportunities were managed and visualized. I was involved throughout the implementation, from the initial vendor stage through to the pilot phase.

My role included:

- **Vendor implementation:** Participated in the vendor selection process and conducted the initial Monday.com demonstration and onboarding session.
- **Process design:** Translated existing staffing and project-management needs into digital workflows, helping structure how information should be captured, managed, and visualized.
- **Dashboard development:** Independently learned Monday.com and built **five interconnected dashboards** serving different operational needs, including staffing, project management, and leadership reporting.
- **Operational planning:** Developed dashboards to provide visibility into **staffing requirements, capacity, business opportunities, revenue, and project efforts**, supporting both operational planning and leadership forecasting.
- **Workflow automation:** Configured workflows, automations, and views to reduce manual coordination and make information easier to manage and access.
- **Pilot implementation:** Supported a **five-month implementation project**, taking the solution from initial vendor engagement through to a pilot involving **5 teams and approximately 30 consultants**.

- **Training & adoption:** Created guidance and trained users on the new system to support adoption across the pilot teams.
- **Feedback & continuous improvement:** Collected feedback from users, monitored how the tool was being used, identified issues and improvement opportunities, and incorporated these learnings into the implementation.

What this experience demonstrates

This project gave me hands-on experience in **process improvement, digital transformation, workflow design, stakeholder management, change implementation, and operational reporting.**

Rather than simply implementing a software tool, I worked on translating an existing business process into a more structured digital system — improving visibility, standardizing workflows, and creating better information for operational and leadership decision-making.

Data-Driven Decision Making

- **Market analysis:** Researched European eHealth markets, comparing initiatives, incentives and digital-health indicators to recommend **3 potential priority markets.**
- **Operational dashboards:** Used **Power BI** to structure information on 100+ consultants, including expertise, location and project experience, making it easier to identify internal resources and expertise.
- **Staffing & forecasting:** Built Monday.com dashboards to provide visibility into **staffing, capacity, business opportunities, revenue and project efforts**, supporting leadership planning.
- **Project reporting:** Used project data and feedback during the Monday.com pilot to identify issues, assess adoption and inform improvements to the implementation.
- **Client & portfolio reporting:** Supported the Marketing team with **client and portfolio reports**, translating business information into structured reports for stakeholders.
- **Academic research:** Your Master's thesis involved an **integrative literature review of 104 academic papers**, using thematic analysis and the Gioia methodology — this demonstrates strong research, synthesis and evidence-based thinking, although I wouldn't present it as business analytics.

KPI Reporting

I have experience using operational data and reporting tools to create visibility into business performance and support planning and decision-making.

At Siemens Healthineers, I developed reporting dashboards in **Monday.com and Power BI** to make operational information easier to track and interpret.

Monday.com Operational Dashboards

As part of the implementation of a new staffing and project management system, I built **five dashboards** covering different operational and management needs.

The dashboards provided visibility into:

- **Staffing and resource allocation**
- **Project workload and effort**
- **Business opportunities**
- **Revenue**
- **Capacity and staffing forecasts**
- **Leadership-level planning and reporting**

I structured the dashboards around the information different stakeholders needed, creating tailored views for consultants, operational teams, and leadership.

The dashboards were introduced as part of a **five-month implementation and pilot across 5 teams and approximately 30 consultants**, with user feedback and adoption data feeding into further improvements.

Power BI & Knowledge Reporting

I also used **Power BI** to create a dashboard covering **100+ consultants**, bringing together information such as expertise, location, and previous project experience.

The goal was not simply to report data, but to make internal expertise easier to identify and use — helping consultants find relevant colleagues and resources for new projects and knowledge exchange.

What this experience demonstrates

KPI & operational reporting · Dashboard development · Performance visibility · Data visualization · Resource planning · Forecasting · Management reporting · Power BI · Monday.com

Entrepreneurship

I believe entrepreneurship is more than a skill. It is a mindset. And it is a mindset I have developed and nurtured from an early age.

My interest in entrepreneurship started in high school, where I participated three times in **Junior Achievement**, working in teams to develop concrete business ideas and business plans and compete nationally against students from other schools. In one of these competitions, our team reached the **national final, placing among the top five teams**.

In my final year of high school, I took this interest further by developing a business idea as part of my thesis, which went on to **win a national competition for the best business idea**.

I continued to build on this foundation during my Master's in **Innovation Management, Entrepreneurship and Sustainability**, where entrepreneurship was a central part of my studies. Through venture creation and entrepreneurship modules, I explored how ideas are

developed, validated, and transformed into viable businesses, while also working on the creation and development of my own business concept.

For me, entrepreneurship is ultimately about **seeing opportunities, questioning how things are done, taking initiative, and turning ideas into action**. It is a way of thinking that I have carried with me throughout my education and professional experience.

My Master's research further deepened my interest in entrepreneurship, examining the elements of entrepreneurial mindset and how they can be effectively developed through higher education. Through this research, I analyzed a large body of academic literature to understand how entrepreneurial capabilities can be cultivated and translated into educational practice.

Achievements at Siemens Healthineers

I'd say my three biggest achievements at Siemens Healthineers were the Monday.com implementation, the knowledge-management portal, and the learning and development initiatives I worked on.

The Monday.com implementation was probably my biggest project. I was involved in the implementation of a new staffing and project-management solution from the vendor stage through to the pilot. Over five months, I independently learned the platform and built five dashboards, workflows and automations covering staffing, project management, business opportunities, revenue and forecasting. We eventually piloted the solution across five teams and around 30 consultants, and I also supported training and collected feedback to improve the system.

Another achievement I'm particularly proud of was helping develop a knowledge-management solution for the consulting organization. I helped create a centralized portal for consulting resources and project materials, as well as a Power BI dashboard covering more than 100 consultants, their expertise, locations and project experience. We also developed a search mechanism to make it easier for consultants to find relevant colleagues and internal expertise when starting new projects.

The third would be my work around learning and development. I helped design four learning pathways for new, junior and senior consultants, combining training, materials and recorded sessions. I also owned the execution of a one-week on-site bootcamp for more than 10 consultants, coordinating the external training provider, agenda, materials, participants, on-site delivery and feedback.

I think what connects these three achievements is that I wasn't just supporting existing processes — I was helping **build, implement and improve new ways of working**.

Achievements at Atheneum

I'd highlight two things in particular: my progression into a Team Leader role and the commercial impact I had on client accounts.

I joined as an Associate Research Consultant and was promoted to **Team Leader after just one year**, taking on responsibility for managing a two-person team alongside my own client delivery

work. I was responsible for coordinating workloads, priorities and deadlines across multiple concurrent projects, while also tracking individual and team KPIs.

On the client side, I managed **end-to-end delivery across 10+ fast-turnaround projects daily**, translating client requirements into scoped project plans, sourcing and qualifying industry experts, coordinating consultations, and ensuring successful delivery. Over time, this contributed to **€200K+ in annual account growth**, and in my Team Leader role I helped grow one account by **more than €300K in annual revenue**.

What I'm particularly proud of is that my progression wasn't just a change in title. Within a relatively short period, I moved from executing individual research projects to taking responsibility for **client delivery, commercial growth, team management and performance**, while continuing to manage a high volume of projects across multiple industries.
